The rendering engine along with vision input system produces 3D animated graphics, using different techniques, like rasterization and ray-tracing. Being programmed and compiled to be executed on any CPU or GPU straightforwardly, majority of rendering engines are developed upon one or more rendering APIs like Direct3D and/or OpenGL that offers a software abstraction layer for the Graphics Processing Unit (GPU).

Graphics in a game decides its fate. 3D graphics are designed using 3D assets, which are developed and designed in external 3D rendering programs like Maya, Blender etc and are then imported into the game engine. Hence a good game engine must support multiple import formats. Game engine provides a lot of features like lighting effects, shadow, bump maps, blending animation etc to make the imported asset look real.
