A New SiC-GaN-Based Two-Phase Interleaved Bidirectional DC-DC Converter for Plug-In Electric Vehicles. Abstract: Wide Band Gap (WBG) semiconductor technologies such as Silicon Carbide (SiC) and Gallium Nitride (GaN) are considered as the future of power electronic devices. Especially, in hard-switching applications where switching power losses are important, GaN devices are more attractive because of their very low gate charge amount.

two-phase interleaved boost converter n=2, which is 180 degrees and it is shown in Fig.2. In the figure 1 it can be seen that the input current, i, for two phase interleaved boost converter is the sum of each channels inductors currents. As the two devices are phase-shifted by 180 degrees, the input current ripple produced is the smallest.

Two-Phase, Dual Interleaved Buck–Boost DC–DC Converter for Automotive Applications. Abstract: A two-phase buck-boost converter utilizing dual interleaving is presented in this article. The dual interleaving consists of an interphase transformer (IPT) that doubles the ripple frequency together with two conventional buck-boost switching arms, mitigating the inductor ripple current and aiding to increase the power density of the converter.
