s ~~Arachidonic Acid Metabolism And Tumor~~

Arachidonic acid (AA) and its metabolites have recently generated a heightened interest due to growing evidence of their significant role in cancer biology. Thus, inhibitors of the AA cascade, first and foremost COX inhibitors, which have originally been of interest in the treatment of inflammatory conditions and certain types of cardiovascular disease, are now attracting attention as an arsenal against cancer.

tumorigenesis (Shureiqi & Lippman, 2001). Aberrant arachidonic acid (AA) metabolism, especially COX-2 and 5-lipoxygenase (5-LOX) pathways, are activated during oral carcinogenesis, and can be targeted for cancer prevention (el-Hakim & Langdon, 1991). Recently, we found that inhibition of AA metabolism caused a decrease in HNSCC cell

Arachidonic acid is not carcinogenic, and studies show dietary level is not associated (positively or negatively) with risk of cancers. ARA remains integral to the inflammatory and cell growth process, however, which is disturbed in many types of disease including cancer.

Cyclooxygenase-2 (COX-2), 5-lipoxygenase (5-LOX), and cytochrome P450 (CYP) 4A-mediated arachidonic acid (AA) metabolism play an essential role in human inflammatory disorders. Blocking COX-2 pathway would shunt AA metabolism to the other pathway, thereby decreasing the efficacy and exacerbating adverse effects.

Arachidonic acid and its metabolites (prostaglandins and leukotrienes) are now considered intracellular messengers. 31 Arachidonic acid is a component of membrane phospholipids released either in a one-step process, after phospholipase A 2 (PLA 2) action, or a two-step process, after phospholipase C and DAG lipase actions. Arachidonic acid is then metabolized by cyclooxygenase (COX) and 5 ...

Here we report that the tumor suppressor phosphatase and tensin homolog (PTEN) is oxidized and inactivated during

arachidonic acid (AA) metabolism in pancreatic cancer cell lines expressing COX-2 or 5-LOX. Oxidation of PTEN decreases its phosphatase activity, favoring increased phosphatidylinositol 3,4,5-triphosphate production, activation of Akt and phosphorylation of downstream Akt targets including GSK-3beta and S6K.

~~Akt activation by arachidonic acid metabolism occurs via ...~~

The metabolism of arachidonic acid by COX, LOX, and cytochrome P450 generates eicosanoids, including prostaglandins, leukotrienes, and HETEs . Although the functional role of many eicosanoids remains unknown, a number act as potent mediators of inflammation,

The phorbol ester tumor promoter (12-0-tetradecanoyl-phorbol-13-acetate (10<sup>-7</sup>-10<sup>-9</sup> M) caused a rapid (1-3 hr after addition) release of arachidonic acid and prostaglandins E<sub>2</sub> and F<sub>2</sub>α from chick embryo fibroblasts. This effect was inhibited by cycloheximide and puromycin. Prostaglandin release was more sensitive to inhibition than was arachidonic acid release.
