~~the role of bisphosphonates in the management of bone disease. There were 2.3 million prescriptions for bisphosphonates in Australia in 2003. This group of drugs is very useful in controlling bone pain and preventing pathologic fractures. However, in a small number of patients on bisphosphonates, intractable, painful, non-healing exposed bone~~

~~Bisphosphonates (BP), pyrophosphate analogues with high bone affinity, are the only pharmacological agents currently recommended for the treatment and prevention of MBD and remain the standard of care. Pamidronate and zoledronic acid are the most commonly used BP to treat MBD.~~

~~Bisphosphonate guidelines for treatment and prevention of ...~~

~~Bisphosphonates (BPs) are potent inhibitors of osteoclast-mediated bone resorption, and it is well accepted that tumor cells in bone, especially breast cancer and myeloma cells, can stimulate osteoclast formation and activity leading to the release of growth factors or cytokines, which will further stimulate cancer cells' growth and their secretion of osteolytic factors.~~

~~Oral bisphosphonates are only licensed for use in postmenopausal women. Prescribe bisphosphonates with caution to: People with upper gastrointestinal (GI) problems, due to the risk of oesophageal reactions. These include: Dysphagia, oesophageal disease, gastritis, duodenitis, and peptic ulceration.~~

~~Bisphosphonates (see Table 1 on page 2) are drugs that inhibit bone resorption and decrease bone turnover, as assessed by biochemical markers, by hindering the formation, recruitment and function of osteoclasts. Bisphosphonates are internalized by osteoclasts, causing disruption of~~

~~Herbert Fleisch, in Bisphosphonates in Bone Disease (Fourth Edition), 2000 Bisphosphonates , formerly called diphosphonates, are compounds characterized by two C–P bonds. If the two bonds are located on the same carbon atom, resulting in a P–C–P structure, the compounds are called geminal bisphosphonates.~~

~~Bisphosphonates are bone antiresorptive agents widely used to treat postmenopausal or glucocorticoid-induced osteoporosis and other conditions characterized by excessive osteoclastic bone resorption, such as Paget's disease, multiple myeloma, osteolytic bone metastases, and humoral hypercalcemia of malignancy.~~

~~Bisphosphonates in Chronic Kidney Disease; Balancing ...~~

~~Bisphosphonates are used to treat osteoporosis, osteitis deformans (Paget's disease of the bone), bone metastasis (with or without hypercalcaemia), multiple myeloma, and other conditions involving fragile, breakable bone. In osteoporosis and Paget's, the most popular first-line bisphosphonate drugs are alendronate and risedronate.~~

~~Bisphosphonate - Wikipedia~~

~~Bisphosphonates are recommended for people where there is evidence of myeloma-related bone disease. Most people with myeloma receive regular bisphosphonate therapy for at least a year. At 12 months there is generally a review where the treating team may then reassess your need for further bisphosphonate therapy.~~

~~Bisphosphonates - Leukaemia Foundation~~

~~It is now clear that bisphosphonates inhibit bone resorption by being selectively taken up and adsorbed to mineral surfaces in bone, where they interfere with the action of the bone-resorbing osteoclasts. Bisphosphonates are internalised by osteoclasts and interfere with specific biochemical processes.~~

~~Bisphosphonates: the first 40 years - PubMed~~

~~Today, bisphosphonates have been widely used during the last 3 decades in the treatment of diseases involving excessive bone resorption which include post-menopausal osteoporosis, Paget's disease of bone, tumour-associated bone disease, and hypercalcaemia of malignancy.~~

~~Bisphosphonates and bone diseases: past, present and ...~~

~~Multiple myeloma (MM) is a haematological malignancy characterised by the clonal proliferation of plasma cells in the bone marrow. More than 80% of patients with MM display evidence of myeloma bone disease (MBD), characterised by the formation of osteolytic lesions throughout the axial and appendicular skeleton.~~

~~Bisphosphonate guidelines for treatment and prevention of ...~~

~~Nitrogen-containing bisphosphonates are among the first line medications being used to treat Paget's disease of bone. They suppress disease activity by reducing osteoclast-mediated bone resorption and bone turnover, which is reflected by the reduction or normalization of the raised serum ALP level.~~
