Centrifugal Compressors Centrifugal compressor is a " dynamic " machine. Has a continuous flow of fluid that receives energy from an integral shaft impeller. Energy transformed into pressure – partly across the impellers and partly in the stator section called diffusers

BASICS OF CENTRIFUGAL COMPRESSOR. In Hydraulic System. In our recent posts, we were focused on the basics of centrifugal compressor. We have seen the various posts based on the working principle, velocity diagram of centrifugal compressor, slip phenomenon and slip factor, Mach number for centrifugal compressor, function of diffuser and various losses in centrifugal compressor and these posts are as mentioned below.

Centrifugal compressors: Basics and operational range. Centrifugal compressors are the dynamic type, meaning that compression is accomplished through the conversion of kinetic energy to static energy. The defining characteristic of centrifugal compressors is that head is determined by the volume flow through the unit.

Centrifugal compressor configurations Flow exits an impeller in both a radial direction and a tangential direction, and is often described as swirling outward. The control, or guidance, of this swirling flow is one of the primary purposes of a centrifugal compressor ' s stationary components. The other purpose is to efficiently convert the

### Back to Basics Selecting a Centrifugal Compressor

Centrifugal compressors run at speeds between 20,000 and 30,000 RPM. They are typically engine or turbine driven. Turbines are commonly used due to high rotating speeds. Centrifugal compressors are used in pipeline booster service where high volume and low compression ratios exist. They are also used in very high flow rate gas lift service.

Centrifugal compressors, sometimes called radial compressors, are a sub-class of dynamic axisymmetric work-absorbing turbomachinery. They achieve a pressure rise by adding kinetic energy / velocity to a continuous flow of fluid through the rotor or impeller.
