DNA cloning: A personal view after 40 years | PNAS

One method is to conduct 2 ligations for each plasmid you are trying to create, with varying ratios of recipient plasmid to insert. It is also important to set up negative controls in parallel. For instance, a ligation of the recipient plasmid DNA without any insert will tell you how much background you have of uncut or self-ligating recipient plasmid backbone.

Addgene: Plasmid Cloning by PCR (with Protocols)

The DNA cloning in the desired host can still be achieved via the

# Get Free Cloning Paper Plasmid

employment of shuttle vectors containing the plasmid origins of replication for both the *E. coli* and the target organism. Thus, the initial cloning of the desired DNA fragment within a shuttle vector in *E. coli* is followed by the introduction of the selected recombinant plasmid into the target species.

Recombinant Plasmid - an overview | ScienceDirect Topics

We recommend using a 1:1, 1:3 or 3:1 molar ratio of vector:insert DNA when cloning a fragment into a plasmid vector. The following example of a ligation reaction consists of a 3.0kb vector and a 0.5kb insert DNA uses the 1:3 vector:insert ratio. Typical ligation reactions use 100–200ng of vector DNA.
