First you must import your data into R. This typically means that you take data stored in a file, database, or web application programming interface (API), and load it into a data frame in R. If you can't get your data into R, you can't do data science on it! Once you've imported your data, it is a good idea to tidy it. Tidying your data means storing it in a consistent form that matches the semantics of the dataset with the way it is stored.

The typology of levels of measurement is one such typology of data types. In this case the R data types largely encode the semantics of the variables; e.g. integer variables are stored as integers, categorical variables with no order are stored as character vectors and so on. However, that is not always the case.
