Protein Synthesis Protein synthesis relies on the effective communication of the coded information held in the genes to the sites of protein manufacture, the ribosomes in the cytoplasm. Since DNA is part of larger structures (chromosomes), which are unable to move from the nucleus, intermediate messenger molecules are needed.

This resource is a full lesson powerpoint which includes an introduction to DNA structure followed by a series of activities which lead students towards developing their own explanations of how proteins are made, followed by exam practice and a plenary task. The main activity in the powerpoint is best introduced without any prior explanation of the theory of protein synthesis, so that students can then complete the follow up task based on their own understanding acquired through the activity.

2. Ribosomal RNA (rRNA) Ribosomes, the organelles of protein synthesis, consist of several types of rRNA and about 70 kinds of polypeptides. In eukaryotes, the production of ribosomes takes place in an area of the nucleus called the nucleolus, where several hundred thousands of ribosomes are produced per hour. Such rapid production is possible only because a eukaryotic cell ' s DNA contains up ...
