Restriction Enzymes: DNA Scissors. Name \_\_\_\_\_.

Background: DNA fingerprinting is made possible in part by special enzymes that cut DNA. These enzymes are called restriction enzymes. Restriction enzymes are proteins that bacteria use to cut up DNA that doesn't belong to them. If a bacterium senses that a virus is trying to invade, or a different species of bacterium represents a threat, it can use a restriction enzyme to cut up the foreigner's DNA.

~~Restriction Enzymes: DNA Scissors~~

They act as DNA scissors, cutting the foreign DNA into pieces so that it cannot function. A nuclease is any enzyme that cuts the phosphodiester bonds of the DNA backbone, and an endonuclease is an enzyme that cuts somewhere within a DNA molecule. In contrast, an exonuclease cuts phosphodiester bonds by starting from a free end of the DNA and working inward.

HaeIII) will cut DNA once every 256 (or 44) base pairs, while an enzyme that recognizes a six base pairs long site (e.g., EcoRI) will cut once every 4096 (or 46) base pairs. Therefore, the longer a DNA molecule is, the greater the probability is that it contains one or more restriction sites. For example, if EcoRI is used to digest human chromo-
