Calcium drilling fluids are more difficult to run as most common additives adversely react with divalent ions; there are some tolerant materials available. High calcium systems, in conjunction with high temperatures and hydroaluminium silicates (clays), can form a type of cement, rendering the drilling fluid / mud irretrievably solid.

DRILLING FLUIDS PL-3 IADC Drilling Manual type and concentration of solids in the drilling fluid. Viscos-ity is usually higher for higher density fluids due to the in-creased concentration of weight material such as barite. As a general rule, thicker fluids are needed for larger diameter hole sizes and thinner fluids are needed for smaller hole size.

In Drilling engineering, drilling fluid, also called drilling mud, is used to aid the drilling of boreholes into the earth. Often used while drilling oil and natural gas wells and on exploration drilling rigs, drilling fluids are also used for much simpler boreholes, such as water wells.
