A circuit that deals with AC is referred to as AC circuit and a circuit with DC source is termed as DC circuit. As of now we only discuss about DC circuit and its theory. The DC source allows the electricity or current to flow with an unvarying polarity that doesn ' t change with time. A simple DC circuit is given in below figure to make the reader get aware of DC circuit components and its parameters.

voltage divided by R3 while I1 is the voltage across R1 divided by R1. This voltage is  $V_a - V_b$ .  $(V_a - V_b)/R1 + (V_c - V_b)/R2 = V_b/R3$  Noting that  $V_a = E1$  and  $V_c = E2$ , with a little algebra this can be reduced to:  $E1(1/R1) + E2(1/R2) = V_b(1/R1 + 1/R2 + 1/R3)$  All quantities are known except for  $V_b$ .

In DC Circuits, We can improve the Circuit power factor by Capacitors. Explanation: There is no concept of power factor improvement in DC Circuits because the phase angle ( ) between Current (I) and voltage (V) is 0 and the then power factor becomes  $\cos 0 = 1$ . So power factor in DC Circuits is 1 and Only 1.
