The link between the physical world and its visualization is geometry. This easy-to-read, generously illustrated textbook presents an elementary introduction to differential geometry with emphasis on geometric results. Avoiding formalism as much as possible, the author harnesses basic mathematical skills in analysis and linear algebra to solve interesting geometric problems, which prepare ...

ELEMENTARY DIFFERENTIAL GEOMETRY. 1-1. Curves. In the first chapters of this book we study plane differential geometry. We start with an investigation of the various definitions of a curve. Our intuitive notion of a "curve" contains so many different features that it is necessary to introduce a number of concepts in order to arrive at an exact ...

Elementary Topics in Differential Geometry by John A. Thorpe

pR^n has the form $(p;v)$ where p is the point of attachment or base-point and v is the vector part of $(p;v)$. The set T . pR^n is naturally a vector space by: $(p;v) + (p;w) = (p;v+w)$ & $c(p;v) = (p;cv)$: Moreover, the dot-product and norm are defined by the usual formulas on the vector part: $(p;v) \cdot (p;w) = v \cdot w$.

In the past decade there has been a significant change in the freshman/ sophomore mathematics curriculum as taught at many, if not most, of our colleges. This has been brought about by the introduction of linear algebra into the curriculum at the sophomore level. The advantages of using linear algebra both in the teaching of differential equations and in the teaching of multivariate calculus ...

Elementary Topics in Differential Geometry - J. A. Thorpe ...

Differential geometry arguably offers the smoothest transition from the standard university mathematics sequence of the first four semesters in calculus, linear algebra, and differential equations to the higher levels of abstraction and proof encountered at the upper division by mathematics majors.

First Steps in Differential Geometry: Riemannian, Contact ...

The geometrical study of a surface M in Euclidean space R^3 separates into three distinct categories: the intrinsic geometry of M , the shape of M in R^3 , and the Euclidean geometry of R^3 . Geometry of R^3 is based on the dot product and consists of those concepts preserved by the isometries of R^3 . The chapter emphasizes that the geometry of M is also based on the dot product—applied only to vectors tangent to M —and that it consists of those features preserved by the isometries of M .
