A developer's knowledge of a computing system's requirements is necessarily imperfect because organizations change. Many requirements lie in the future and are unknowable at the time the system is designed and built. To avoid burdensome maintenance costs developers must therefore rely on a system's ability to change gracefully-its flexibility. Flex

Software flexibility can mean a lot of things but when it is used to describe a whole system, it normally refers to the ability for the solution to adapt to possible or future changes in its requirements. When you design or build a solution you should try to cater for these changes which inevitably arrive in the future.

The software development process is driven by requirements. Typically, the focus is on defining precise requirements and then implementing exactly those requirements. However, once delivered, virtually every major software product produces major disappointments for its customers as new requirements emerge.
