However, hydrology and ecology of LU was never the subject of an in-depth scientific study. An interdisciplinary and integrated approach was applied to (a) quantify LU's size variations over the last 20 years and (b) investigate the controlling factors of LU's hydrological regime, its hydrogeochemistry and sediment composition. 2.

She has written widely on the hydrology, geomorphology and ecology of rivers, including over 100 refereed journal articles, 25 book chapters and 10 edited books and journal special issues. Her recent research has been concerned with two main themes: the role of vegetation in influencing the form and function of river systems; the characteristics and rehabilitation of urban rivers.

The aim of this Special Issue is to bring together recent research that advances understanding of the hydrology, geomorphology, and ecology of intermittent rivers and streams. We welcome contributions addressing any one of these topics and disciplines as well as interdisciplinary studies that link physical and biological components of intermittent stream systems.

Hydrogeomorphology has been defined as "an interdisciplinary science that focuses on the interaction and linkage of hydrologic processes with landforms or earth materials and the interaction of geomorphic processes with surface and subsurface water in temporal and spatial dimensions." The term 'hydro-geomorphology' designates the study of landforms caused by the action of water.

The geomorphology, hydrology, and ecology of river systems interact through complex processes occurring across a range of spatial and temporal scales. The interface among these processes and the desire to manage river systems for natural and human benefit attract researchers from many disciplines.

Abstract. Beavers (castor fiber, castor canadensis) are the most influential mammalian ecosystem engineer, heavily modifying river corridors and influencing hydrology, geomorphology, nutrient cycling, and ecology. As an agent of disturbance, they achieve this first and foremost through dam construction, which impounds flow and increases the extent of open water, and from which all other landscape and ecosystem impacts follow.

Geomorphology is the study of landforms and landform evolution. The topic traditionally has been studied both qualitatively, which is the description of landforms, and quantitatively, which is process-based and describes forces acting on Earth's surface to produce landforms and landform change.

Geomorphology is the study of how planetary landscapes change through time in response to physical, chemical, and biological processes. Researchers in the department study landscapes over a wide range of scales, from particle-scale sediment transport to the global evolution of planetary surfaces, utilizing a variety of methods including computational modeling, field studies, and experimental work.

Hydromorphology is a term used in river basin management to describe the hydrological (water flow, energy etc) and geomorphological (surface features) processes and attributes of rivers, lakes, estuaries and coastal waters. The Water Framework Directive (WFD) dictates that the ecology of surface waters is protected by correctly managing their hydrology and geomorphology.

Published by the American Geophysical Union as part of the Water Science and Application Series, Volume 7. The Deschutes is a peculiar dammed river in Oregon. Its dramatic juxtaposition of geology, topography, and climate presents a virtual textbook of landforms and geomorphic processes revealing Quaternary, Holocene, and very recent events of immense magnitude.
