Temperature is a measurement of how hot or cold something is. An object's temperature doesn't tell us how much heat energy it has. It's easy to see why not if you think about an iceberg and an ice cube.

### 1. How Heat

Affects

Molecules. We

explained

earlier that

heat energy

causes molecules

in an object to

behave in a

certain way:

when an object

is hot,

molecules move

fast. When it's

cold, they move  
slowly. But what  
does that mean?

In this simple  
heat experiment,  
students will  
better  
understand how  
molecules act in  
cold, hot and  
warm  
temperatures.
