Explainer: how do drugs work? - The Conversation

A drug is a chemical that interacts with proteins in the body to affect a physiological function. This is the general idea behind all medicine. Once these chemicals are absorbed into the systemic circulation they bind with certain proteins and this changes the functioning of the cell slightly.

and unwanted effects of drugs in the body. This is achieved by integrating knowledge from a range of biosciences including how the body works in health and disease. This subject uses specific examples of instantly recognizable and newly developed drugs to demonstrate how pharmacologists identify drug targets, design new drugs and test their therapeutic effectiveness.
