factor in aircraft accidents. Volume 8 has been structured to not only provide all of the necessary information to pass the JAR-FCL examination, but it is also of value to all pilots and especially to those involved with the human factors elements of Crew Resource Management (CRM).

Trade Paperback + PDF eBook "bundle" version: Trade paperback book comes with code to download the eBook from ASA's website. This comprehensive textbook explains the aerodynamics of helicopter flight as well as helicopter maneuvers, going beyond the strictly "how-to" type of aviation manual. Helicopter pilots need to thoroughly understand the consequences of their actions and base them upon sound technical knowledge; this textbook explains why the helicopter flies and even more importantly, why it sometimes does not. Beginning with aerodynamics, each step of the process is fully illustrated and thoroughly explained--from the physics of advanced operations to helicopter design and performance--providing helicopter pilots with a solid foundation upon which to base their in-flight decisions. Containing discussions on the NOTAR (no tail rotor) system, strakes, principles of airspeed and high-altitude operations, operations on sloping surfaces, and sling operations, this revised edition also includes the latest procedures Federal Aviation Administration.

This volume provides an in-depth knowledge of the operating principles behind, and the value of, all the most common aircraft instrumentation systems. Materials covered include flight instruments, automatic flight control systems, warning and recording equipment, powerplant and system monitoring instruments.

This text is a guide to aviation law for managers, pilots, mechanics, aircraft owners, air traffic controllers, air safety investigators, or others involved in aviation as a profession or hobby. It provides the basic knowledge and perspective to understand how the legal system works in relation to aviation. Helps readers recognize and avoid common legal pitfalls, and be able to discern when they need to call a lawyer. It provides a foundation to a complex field of law. Contains frequent examples, many drawn from the author's experience in practice. The fifth edition has been updated and expanded to reflect statutory and regulatory changes.

Human error is cited as a major cause in over 70% of accidents, and it is widely agreed that a better understanding of human capabilities and limitations - both physical and psychological - would help reduce human error and improve flight safety. This book was first published when the UK Civil Aviation Authority introduced an examination

in human performance and limitations for all private and professional pilot licences. Now the Joint Aviation Authorities of Europe have published a new syllabus as part of their Joint Aviation Requirements for Flight Crew Licensing. The book has been completely revised and rewritten to take account of the new syllabus. The coverage of basic aviation psychology has been greatly expanded, and the section on aviation physiology now includes topics on the high altitude environment and on health maintenance. Throughout, the text avoids excessive jargon and technical language. "There is no doubt that this book provides an excellent basic understanding of the human body, its limitations, the psychological processes and how they interact with the aviation environment. I am currently studying for my ATPL Ground Exams and I found this book to be an invaluable aid. It is equally useful for those studying for the PPL and for all pilots who would like to be reminded of their physiological and psychological limitations." -General Aviation, June 2002

Exams for the preparation of obtaining the FAA Instrument Pilot rating.
