Magnetic Resonance Imaging (MRI) is a non-invasive imaging technology that produces three dimensional detailed anatomical images. It is often used for disease detection, diagnosis, and treatment monitoring.

~~Magnetic Resonance Imaging (MRI)~~

Magnetic resonance imaging (MRI) is a medical imaging technique used in radiology to form pictures of the anatomy and the physiological processes of the body. MRI scanners

use strong magnetic fields , magnetic field gradients, and radio waves to generate images of the organs in the body.

~~Magnetic resonance imaging - Wikipedia~~

Magnetic resonance imaging (MRI) is based on the principles of nuclear magnetic resonance (NMR), a spectroscopic technique used to obtain microscopic chemical and physical information about molecules. MRI is based on the absorption and emission of energy in the radiofrequency (RF) range of the electromagnetic spectrum.

One key technique that circumvents some of these issues is magnetic resonance imaging (MRI). Mapping water. MRI was first used for imaging in the 1970s and since then, has seen many improvements.

An MRI or magnetic resonance imaging is a radiology technique scan that uses magnetism, radio waves, and a computer to produce images of body structures. The MRI scanner is a tube surrounded by a giant circular magnet. The patient is placed on a moveable bed that is inserted into the magnet.
