01 07 Equivalent CBR by Plate Bearing Test

test. For bearing plates, three circular steel bearing plates, not less than 25mm in thickness and varying in diameter from 300mm to 1000mm including the minimum and maximum diameter specified or square steel bearing plates of equivalent area. In rock, plates larger than 1000mm diameter may be used, depending on the jointing frequency. As an alternative, three small concrete footings of the ...

SPECIFICATION FOR PLATE LOAD TEST 1.0 SCOPE

The plate bearing test site is prepared, and any loose materials are removed to make sure that the seventy-five-centimeter diameter plate can rest horizontally and by full contact to the soil subgrade. In case there is need of natural ground for reaction modulus of sub-grade, the topsoil can be removed to a depth of not more than twenty centimeters before testing.

Plate bearing test procedure and calculation | CBR Testing ...

A Plate Load Testing Guide A plate loading test is used to establish the full bearing capacity of the ground, and the possible settlement when subjected to a load. The findings of this test are applied in the designing temporary working stations for piling pads or rigs for crane outriggers.

A Complete guide to plate load testing | CBR Testing UK ...

A plate load test at the site conducts to determine the allowable bearing pressure. A pit of size 5 Bp X 5 Bp excavates to the depth equal to the depth of the foundation to conduct a plate load test at the site. The plate should be made of steel with a size of 0.3 m² and it should be 25 mm thick. Occasionally, circular plates are also used.

Plate Load Test:- Procedure, Bearing Capacity, and ...

Plate bearing test is carried out in the field to serve this purpose. Results from the test can be used as design parameter or used to confirm the design assumption. The test shall be carried out in general accordance with BS 1377: Part 9 1990 'in-Situ Tests'. A circular plate having a maximum diameter of 300 - 600mm shall be used.

Plate Bearing Test - In Situ BS 1377 Part 9 : 1990 ...

Plate Bearing Test also known as plate load test or static loading test, is an in-situ load bearing test of soil. The activity of plate bearing test is performed in order to determine the bearing capacity of soil underneath that is likely to take the anticipated load of temporary or a permanent structure.

Plate Bearing Test (Complete Guide WITH PICTURES) Define Civil

Plate load test is a field test which is commonly adopted to determine the bearing capacity and settlement of soil under a given condition of loading. In this test a square or circular rigid plate of standard dimension (generally 300 mm² for square or 300 mm dia for circular) is placed at foundation level and load is applied in increments.

HOW TO CALCULATE BEARING CAPACITY OF SOIL FROM PLATE LOAD ...

Plate Load Test is a field test for determining the ultimate bearing capacity of soil and the likely settlement under a given load. The Plate Load Test basically consists of loading a steel plate placed at the foundation level and recording the settlements corresponding to each load increment.

Plate Load Test - Determine Bearing Capacity of Soils

A Plate Load Test determines the actual strength, as well as the bearing capacity of ground, and is used when the testing involves large particle sizes or soils that have a harder texture. The CBR test is commonly used for road/pavement design to assess the strength of the sub-grade and is suitable for areas where the particle sizes are no more than 20mm.

Plate Bearing & CBR Testing - SOCOTEC

The plate bearing test process is conducted following the part 9: 1990 of the BS 1337 standard. The test requires some significant steps

Download Ebook Manual For Plate Bearing Test Results

that involve various apparatus. The new testing method continues to grow day by day. The process includes load tests to the soil, coming up with settlements and determination of the bearing capacities.

Plate Bearing Testing and How to Perform Them

Typically, the Plate Bearing Test is used in designing temporary working structures like pads for crane outriggers or working platforms for the construction machine called piling rigs. Approximately equivalent California Bearing Ratio values can be obtained from the sub grade reaction Modulus by using mathematical relationship.

Plate Bearing Test | CBR testing

Crane Pads – A Plate Bearing Test will mimic the load of your crane outrigger, establishing the suitability of the crane pad prior to arrival of the crane. This provides reassurance to the constructor of the pad, demonstrates safety for the crane operators, and provides certification for insurers.

Plate Bearing Tests - Geotest

The Plate Bearing Test is carried out in accordance with BS 1377 Part 9: 1990. It basically consists of loading a steel plate of known diameter and recording the settlements corresponding to each load increment. The test load is gradually increased till the plate starts to settle at a rapid rate.

Plate Bearing Test | Southern Testing

The Plate Load Test AX01 is the simple solution to determine the strain moduli E_{v2} and E_{v1} (a figure for the bearing capacity) and the ratio E_{v2}/E_{v1} (a figure for the compaction level). The modulus is an indicator for the bearing capacity of the soil or flexible pavement under the loading plate.

Plate Load Test – How it Works – Measuring E_{v2} and E_{v1}

The plate load test is a field test, which is performed to determine the ultimate bearing capacity of the soil and the probable settlement under a given load. This test is very popular for the selection and design of the shallow foundation.

Plate Load Test - Equipment, Procedure, Calculation ...

Plate load testing or plate bearing testing, is carried out in accordance with BS 1377 Part 9: 1990 Standards, using either an incremental or constant rate of penetration.

Plate Load Testing - GeoCon Site Investigations

Plate bearing test is used in earthworks and soil foundations to evaluate the composition and consequent deformability of the soil. This gives an indication of the total load capacity of the soil under test. Also used in road construction engineering. S224 KIT

Plate bearing apparatus | Matest

Analogue measuring system with dial manometer. The plate bearing test equipment, with 100 kN capacity and 1 dial gauge, includes: S222-01 Hydraulic jack 100 kN capacity, complete with hand pump, rubber pipe with fast connector, set of extension rods of different lengths, carrying case. S222-02 Pressure gauge 0-100 kN, div. 0.5 kN.
