The menstrual cycle is a cyclic series of changes in the uterine lining that correspond with changes in the ovary. We will base our time line on a 28-day cycle, but the cycle is highly variable and in some women it is not a consistent length from one month to another. Since it is a cycle, we can begin with any phase. However, it is customary to call the first day of menstruation Day 1 of the menstrual cycle, because menstruation is visible and easy to document.

The menstrual phase occurs at the very beginning of the uterine cycle. It only occurs if no ovum is fertilised. The process begins with the breakdown of the corpus luteum which therefore ceases to produce progesterone. The loss of progesterone causes vasoconstriction of the spiral arteries supplying the functional layer of the endometrium.
