The human nervous system has two parts: the central nervous system, which includes the brain and spinal cord, and the peripheral nervous system, which is composed of nerves and nerve networks throughout the body. The endocrine system is also essential to communication. The system utilizes glands located throughout the body that secrete hormones.

~~The Nervous and Endocrine Systems - Verywell Mind~~
The study of psychology and the endocrine system is called behavioral endocrinology, which is the scientific study of the interaction between hormones and behavior. This interaction is bidirectional: hormones can influence behavior, and behavior can sometimes influence hormone concentrations.

~~The Human Nervous System: Parts & Functions - Study.com~~

The endocrine system is a chemical messenger system comprising feedback loops of the hormones released by internal glands of an organism directly into the circulatory system, regulating distant target organs. In humans, the major endocrine glands are the thyroid gland and the adrenal glands. In vertebrates, the hypothalamus is the neural control center for all endocrine systems.

~~Endocrine system - Wikipedia~~

Endocrine glands are responsible for hormones being released into the body including the pituitary, adrenals and thyroid. Our brains communicate with our body through hormone production.
