Parasitism has evolved at least 223 times in 15 of 35 recognized animal phyla (Weinstein and Kuris, 2016). It is believed that parasitism evolved through a variety of opportunistic circumstances: from using

shelter, increasing
dispersal potential, and
maintaining more consistent
environmental conditions by
living in close proximity (
Poulin and Morand, 2004).

This review attempted to give some hypothesis-based explanations of parasite diversity and how this parasite diversity impacts the evolutionary ecology of
