A polynuclear aromatic hydrocarbon is a hydrocarbon made up of fused aromatic ring molecules. These rings share one or more sides and contain delocalized electrons. Another way to consider PAHs is molecules made by fusing two or more benzene rings. Polynuclear aromatic hydrocarbon molecules contain only carbon and hydrogen atoms.

What Is a Polynuclear Aromatic Hydrocarbon?

A polynuclear aromatic hydrocarbon is a hydrocarbon whose molecule contains two or more fused benzene rings.

Polynuclear Aromatic Hydrocarbon - Chemistry LibreTexts

Polycyclic aromatic hydrocarbons (PAHs) are sometimes referred to as polynuclear aromatic hydrocarbons (PNAs), condensed ring aromatics, or fused ring aromatics. They are a class of organic compounds consisting of two or more fused aromatic rings. Polycyclic aromatic hydrocarbons most commonly encountered in the environment contain two (naphthalene) to seven (coronene) fused benzene rings, though PAHs with greater number of rings are also found.

Polycyclic Aromatic Hydrocarbon - an overview ...

The terms polycyclic aromatic hydrocarbons and polynuclear aromatic hydrocarbons refer to the same group of organic compounds that contains several cyclic structures of carbon and hydrogen are fused with each other forming a large organic molecule. However, the difference between polycyclic and polynuclear aromatic hydrocarbons lies on the description given by each term; polycyclic refers to “many cycles” while polynuclear refers to “many atoms”.

Difference Between Polycyclic and Polynuclear Aromatic ...

In considering the properties of the polynuclear hydrocarbons relative to benzene, it is important to recognize that we neither expect nor find that all the carbon-carbon bonds in polynuclear hydrocarbons are alike or correspond to benzene bonds in being halfway between single and double bonds.

22.8: Substitution Reactions of Polynuclear Aromatic ...

Metals and polynuclear aromatic hydrocarbons (PAH) may be elevated around oil and gas production platforms, including those in the Gulf of Mexico (Kennicutt et al. 1996; Peterson et al. 1996). The exposure of sediment-dwelling organisms to metal and PAH mixtures may result in toxic endpoints that differ from exposure to individual contaminants.

Mixtures of Metals and Polynuclear Aromatic Hydrocarbons ...

METHOD 610—POLYNUCLEAR AROMATIC HYDROCARBONS. 1. Scope and Application. 1.1 This method covers the determination of certain polynuclear aromatic hydrocarbons (PAH). The following parameters can be determined by this method: Parameter

Method 610: Polynuclear Aromatic Hydrocarbons

A polycyclic aromatic hydrocarbon (PAH) is a hydrocarbon—a chemical compound containing only carbon and hydrogen—that is composed of multiple aromatic rings. The group is a major subset of the aromatic hydrocarbons. The simplest of such chemicals are naphthalene, having two aromatic rings, and the three-ring compounds anthracene and phenanthrene.

Polycyclic aromatic hydrocarbon - Wikipedia

Title: Polynuclear Hydrocarbons 1 Polynuclear Hydrocarbons 2 Classification of Polynuclear Hydrocarbons Polynuclear Hydrocarbons may be divided into two groups, 3. Polynuclear Hydrocarbons ; Benzenoid Non- Benzenoid ; Isolated Fused rings. Linear Angular. 4 Isolated Ring Polynuclear Hydrocarbons Biphenyl (diphenyl) 5 a) Fittig reaction b) From ...

PPT – Polynuclear Hydrocarbons PowerPoint presentation ...

The aromatic hydrocarbons are “ unsaturated hydrocarbons which have one or more planar six-carbon rings called benzene rings, to which hydrogen atoms are attached with the general formula C_nH_n “ . Many aromatic hydrocarbons contain a benzene ring (also referred to as an aromatic ring). The benzene ring is stabilized by resonance and the pi electrons are delocalized in the ring structure.

Aromatic Hydrocarbons - Definition, Examples, Properties ...

Polycyclic aromatic hydrocarbons (PAHs) are organic compounds that are mostly colorless, white, or pale yellow solids. They are a ubiquitous group of several hundred chemically related compounds, environmentally persistent with various structures and varied toxicity. They have toxic effects on organisms through various actions.

A review on polycyclic aromatic hydrocarbons: Source ...

Hydrocarbon like aliphatic, aromatic, or polynuclear aromatic hydrocarbons are types of organic compound processing hydrogen and carbon in the entire molecular formula with one or more single, double or triple bonds in two adjacent carbon atoms. When two or more carbon atoms processing by the single common bond are called saturated hydrocarbons but if the compound containing at least one pair of adjacent carbon atoms liked by multiple bonds are called unsaturated hydrocarbons in chemical ...

Hydrocarbon | Definition, Types & Sources | Priyamstudycentre

Bond length Double bond character The different carbon-carbon bond lengths reveal the decreased aromaticity of fused polynuclear aromatic hydrocarbons. Phenanthrene is an angular polynuclear aromatic hydrocarbon. 7. Resonance Forms of Naphthalene Resonance Forms of Anthracene Resonance Forms of Phenanthrene

Chemistry polycyclic compounds - SlideShare

Polycyclic aromatic hydrocarbons (PAHs) are a class of chemicals that occur naturally in coal, crude oil, and gasoline. They also are produced when coal, oil, gas, wood, garbage, and tobacco are burned. PAHs generated from these sources can bind to or form small particles in the air.

Polycyclic Aromatic Hydrocarbons (PAHs) Fact Sheet

Chemical Classification: Hydrocarbons (contain hydrogen and carbon atoms) Summary: Polycyclic aromatic hydrocarbons (PAHs) are a group of over 100 different chemicals that are formed during the incomplete burning of coal, oil and gas, garbage, or other organic

Download File PDF Polynuclear Aromatic Hydrocarbons Chemistry And Biological Effects Fourth International Symposium On Polynuclear Aromatic Hydrocarbons Series

substances like tobacco or charbroiled meat. PAHs are usually found as a mixture containing two or more of these compounds, such as soot.

Polycyclic Aromatic Hydrocarbons (PAHs) - Toxic Substances

Vigorous reactions, sometimes amounting to explosions, can result from the contact between aromatic hydrocarbons and strong oxidizing agents. They can react exothermically with bases and with diazo compounds. Substitution at the benzene nucleus occurs by halogenation (acid catalyst), nitration, sulfonation, and the Friedel-Crafts reaction.

POLYNUCLEAR AROMATIC HYDROCARBONS | CAMEO Chemicals | NOAA

Hydrocarbons contain only carbon and hydrogen. - they are nonpolar molecules - not soluble in water (water is polar)

Organic Chemistry: Hydrocarbons Flashcards | Quizlet

POLYNUCLEAR AROMATIC HYDROCARBONS by HPLC: METHOD 5506, Issue 3, dated 15 January 1998 - Page 3 of 9 NIOSH Manual of Analytical Methods (NMAM), Fourth Edition SAMPLING: 1. Calibrate each personal sampling pump with a representative sampler in line. 2. Take personal samples at 2 L/min for a total sample size of 200 to 1000 L. 3.
