Practice 8 Exponential Growth And Decay Answers
Exponential growth and exponential decay are two of the most common applications of exponential functions. Systems that exhibit exponential growth follow a model of the form $y = y_0 e^{kt}$. In exponential growth, the rate of growth is proportional to the quantity present. In other words, $y' = ky$.

6.8 Exponential Growth and Decay - Mathematics LibreTexts
In the case of rapid growth, we may choose the exponential growth function: $y = A_0 e^{kt}$ where A_0 is equal to the value at time zero, e is Euler's constant, and k is a positive constant that determines the rate (percentage) of growth.

Exponential growth is proportional to the current value that is growing, so the larger the value is, the faster it grows. Logarithmic growth is the opposite of exponential growth, it grows slower the larger the number is. (6 votes)

Exponential vs. linear growth (video) | Khan Academy
Exponential growth often causes this kind of surprising result, even when considering the vastly large orders of magnitude that come from space. At the end, we solved the equation. $2^n = 3.91 \times 10^{12}$ $2^n = 3.91 \times 10^{12}$ $n = 3.91 \times 10^{12} \log_2 2 = 3.91 \times 10^{12}$. but in a way that required we test out values using the sliders.
