Physics 416/517: Problem Set #7. Due by 5 PM Friday, April 11 th, 2003. Reif, Problems 7.1, 7.3, 7.5, 7.7, 7.14, \* 7.20. Problem 7: \* The energy levels of a particle trapped in a cubical box of volume  $V = L^3$  are given by  $E_{n_x, n_y, n_z} = \frac{h^2}{8mL^2}(n_x^2 + n_y^2 + n_z^2)$ . We can use this to model a single atom of helium trapped in a metal crystal.

Phys416/517: Problem Set #7

The first part of this problem is the solution to Reif 7.24, shown here Problem 7.24 Reif The conditions of the problem make it reasonable to treat the loss of

molecules from the vessel as a result. We can also assume the reverse flux from outside the container is negligible. Let  $N(t)$  be the number of molecules remaining...

### Problem 7.24 Reif

Problem 7.21 Reif We found in Problem 7.20b that the translational kinetic energy probability density  $\rho(\epsilon)$  for a gas with a Maxwellian speed distribution was given by the function  $\rho(\epsilon) = \frac{2}{\sqrt{\pi}} \frac{1}{kT} \epsilon^{1/2} \exp[-\epsilon/kT]$ . (1) The most probable energy  $\epsilon$  is the one that maximizes the value of  $\rho(\epsilon)$ . Thus,
