PNL is the gold standard for the management of large and/or otherwise complex renal stones. Since its introduction in the seventies PNL has undergone considerable evolution, mainly driven by the improvement in access techniques, endoscopic instrument technology, lithotripsy devices and drainage management. The conventional prone position for PNL has been challenged in the last two decades by a variety of modifications, including the supine and Galdakao-modified supine Valdivia positions ...

Supine Percutaneous Nephrolithotomy and ECIRS. First book dealing with supine PNL. The supine position with its modifications is the basis for ECIRS (Endoscopic Combined Intra-Renal Surgery) This book describes in detail the surgical technique step by step, all the instruments and accessories to be employed, the organization of the operating room, the application of this surgical approach to special cases (malignant conditions, malformations, obesity, renal transplant...)

Percutaneous nephrolithotomy (PCNL) was first described by Fernström and Johansson in 1976 in prone position (1). Since then, this surgical approach has become the gold standard for treatment of large stones and it has evolved over time resulting in decrease in invasiveness and morbidity and improvements in ergonomics and outcomes.

**Supine percutaneous nephrolithotomy: tips and tricks—**

Background: Percutaneous nephrolithotomy (PNL) is still the gold-standard treatment for large and/or complex renal stones. Evolution in the endoscopic instrumentation and innovation in the surgical skills improved its success rate and reduced perioperative morbidity. ECIRS (Endoscopic Combined IntraRenal Surgery) is a new way of affording PNL in a modified supine position, approaching antero-retrogradely to the renal cavities, and exploiting the full array of endourologic equipment.

Objective: This study compared the stone opacity effect in patients who had radiopaque and radiolucent stones in percutaneous nephrolithotomy (PCNL) results. Material and methods: The medical records of 171 complete supine PCNL procedures were gathered. Patients were categorized into two groups: those with radiopaque (n=141) and those with radiolucent (n=30) stones.

The Galdakao-modified supine Valdivia position allowed the development of ECIRS (Endoscopic Combined IntraRenal Surgery), a technique exploiting a combined antegrade and retrograde approach to the upper urinary tract, using both rigid and flexible endoscopes with the related accessories.

**Supine Percutaneous Nephrolithotomy and ECIRS eBook by—**

Percutaneous nephrolithotomy is currently one of the main treatment options for large renal stones, but the effect of positioning on comparative costing has been scarcely documented. We aimed to compare the cost effectiveness of modified supine with traditional prone percutaneous nephrolithotomy procedures in the context of Victoria, Australia.

The objective of this study is to assess stone clearance and perioperative complication rates of supine percutaneous nephrolithotomy (PCNL). Methods: This was a retrospective, observational study of supine PCNL performed in a surgical unit at a district general hospital by two surgeons in the United Kingdom. Data collected included patient ...

**A retrospective, observational study of supine—**

Percutaneous nephrolithotomy, or PCNL, is a procedure for removing medium-sized or larger renal calculi (kidney stones) from the patient's urinary tract by means of an nephroscope passed into the kidney through a track created in the patient's back. PCNL was first performed in Sweden in 1973 as a less invasive alternative to open surgery on the ...

**Nephrolithotomy, Percutaneous—procedure, recovery, test—**

Supine percutaneous nephrolithotomy (PCNL) has been described in 1988 and several modifications followed since. Despite claimed benefits, supine PCNL is still neglected by the majority of urologists.
